

Ground truth. Settings 1 and 6 are driven by the SAME f1 -- once in the mean, once in the range.

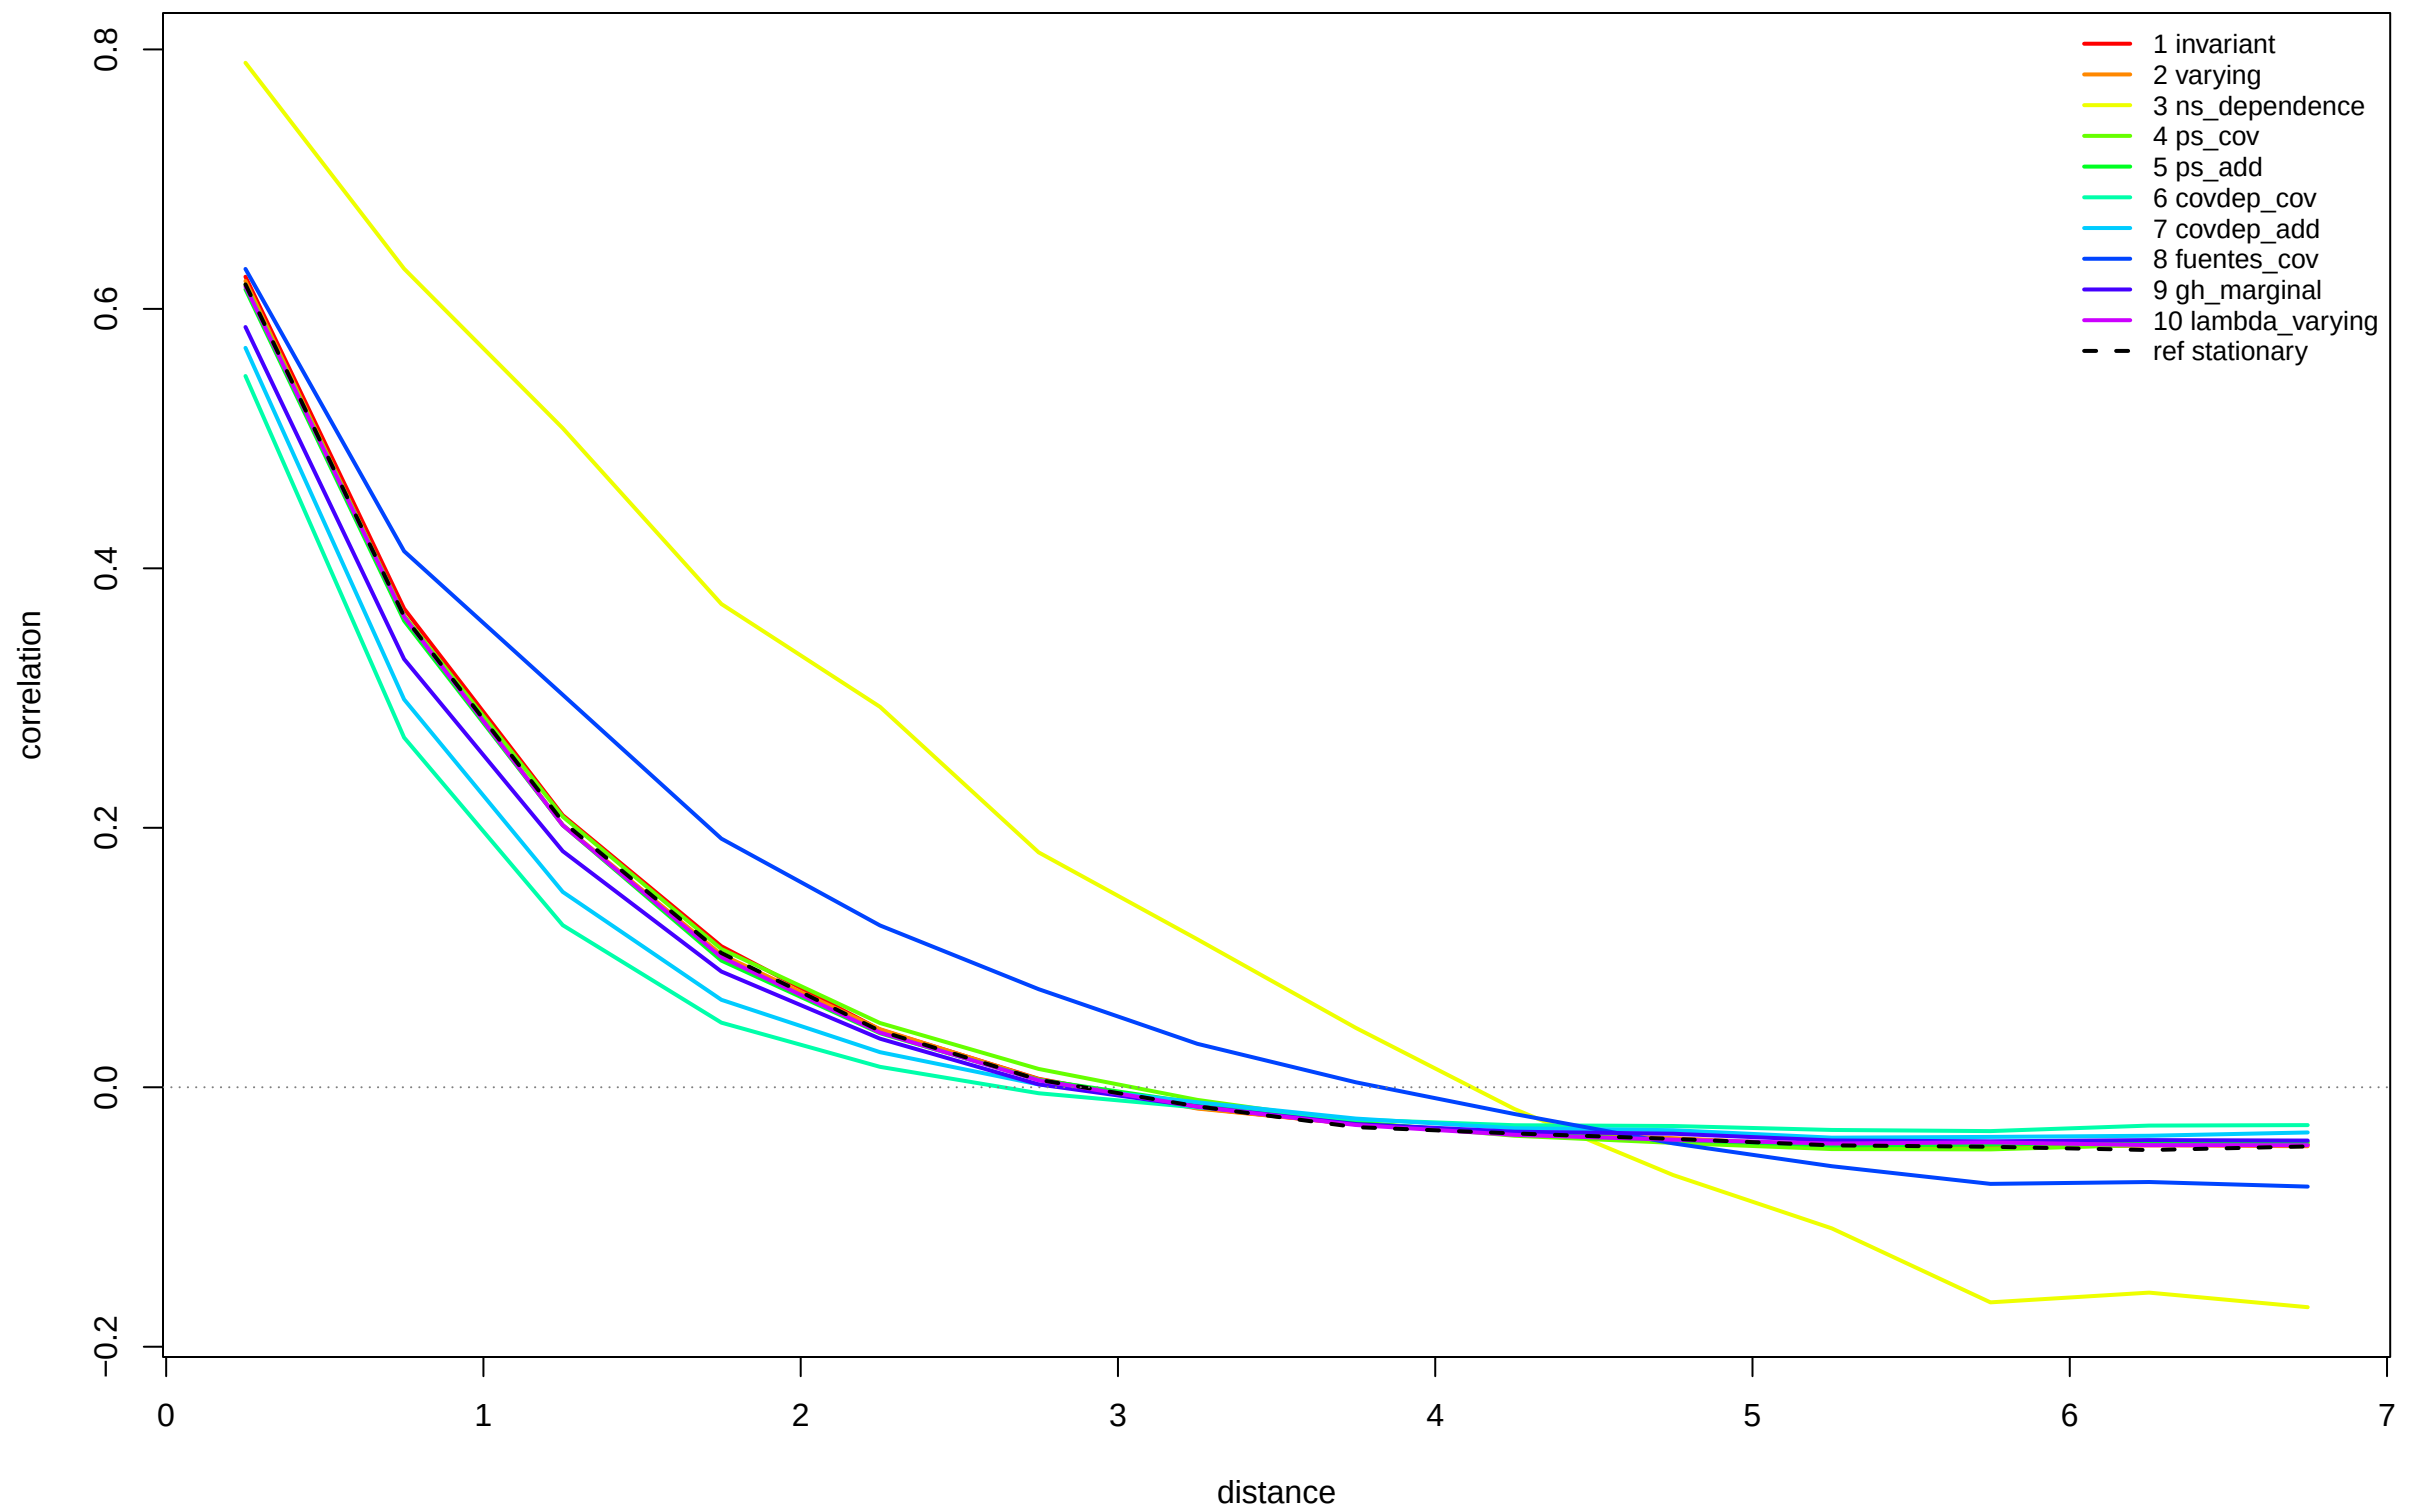

Pointwise sd of the dependence residual --- flat = homoscedastic (4/6/8/9 by design; 3/5/7 vary)

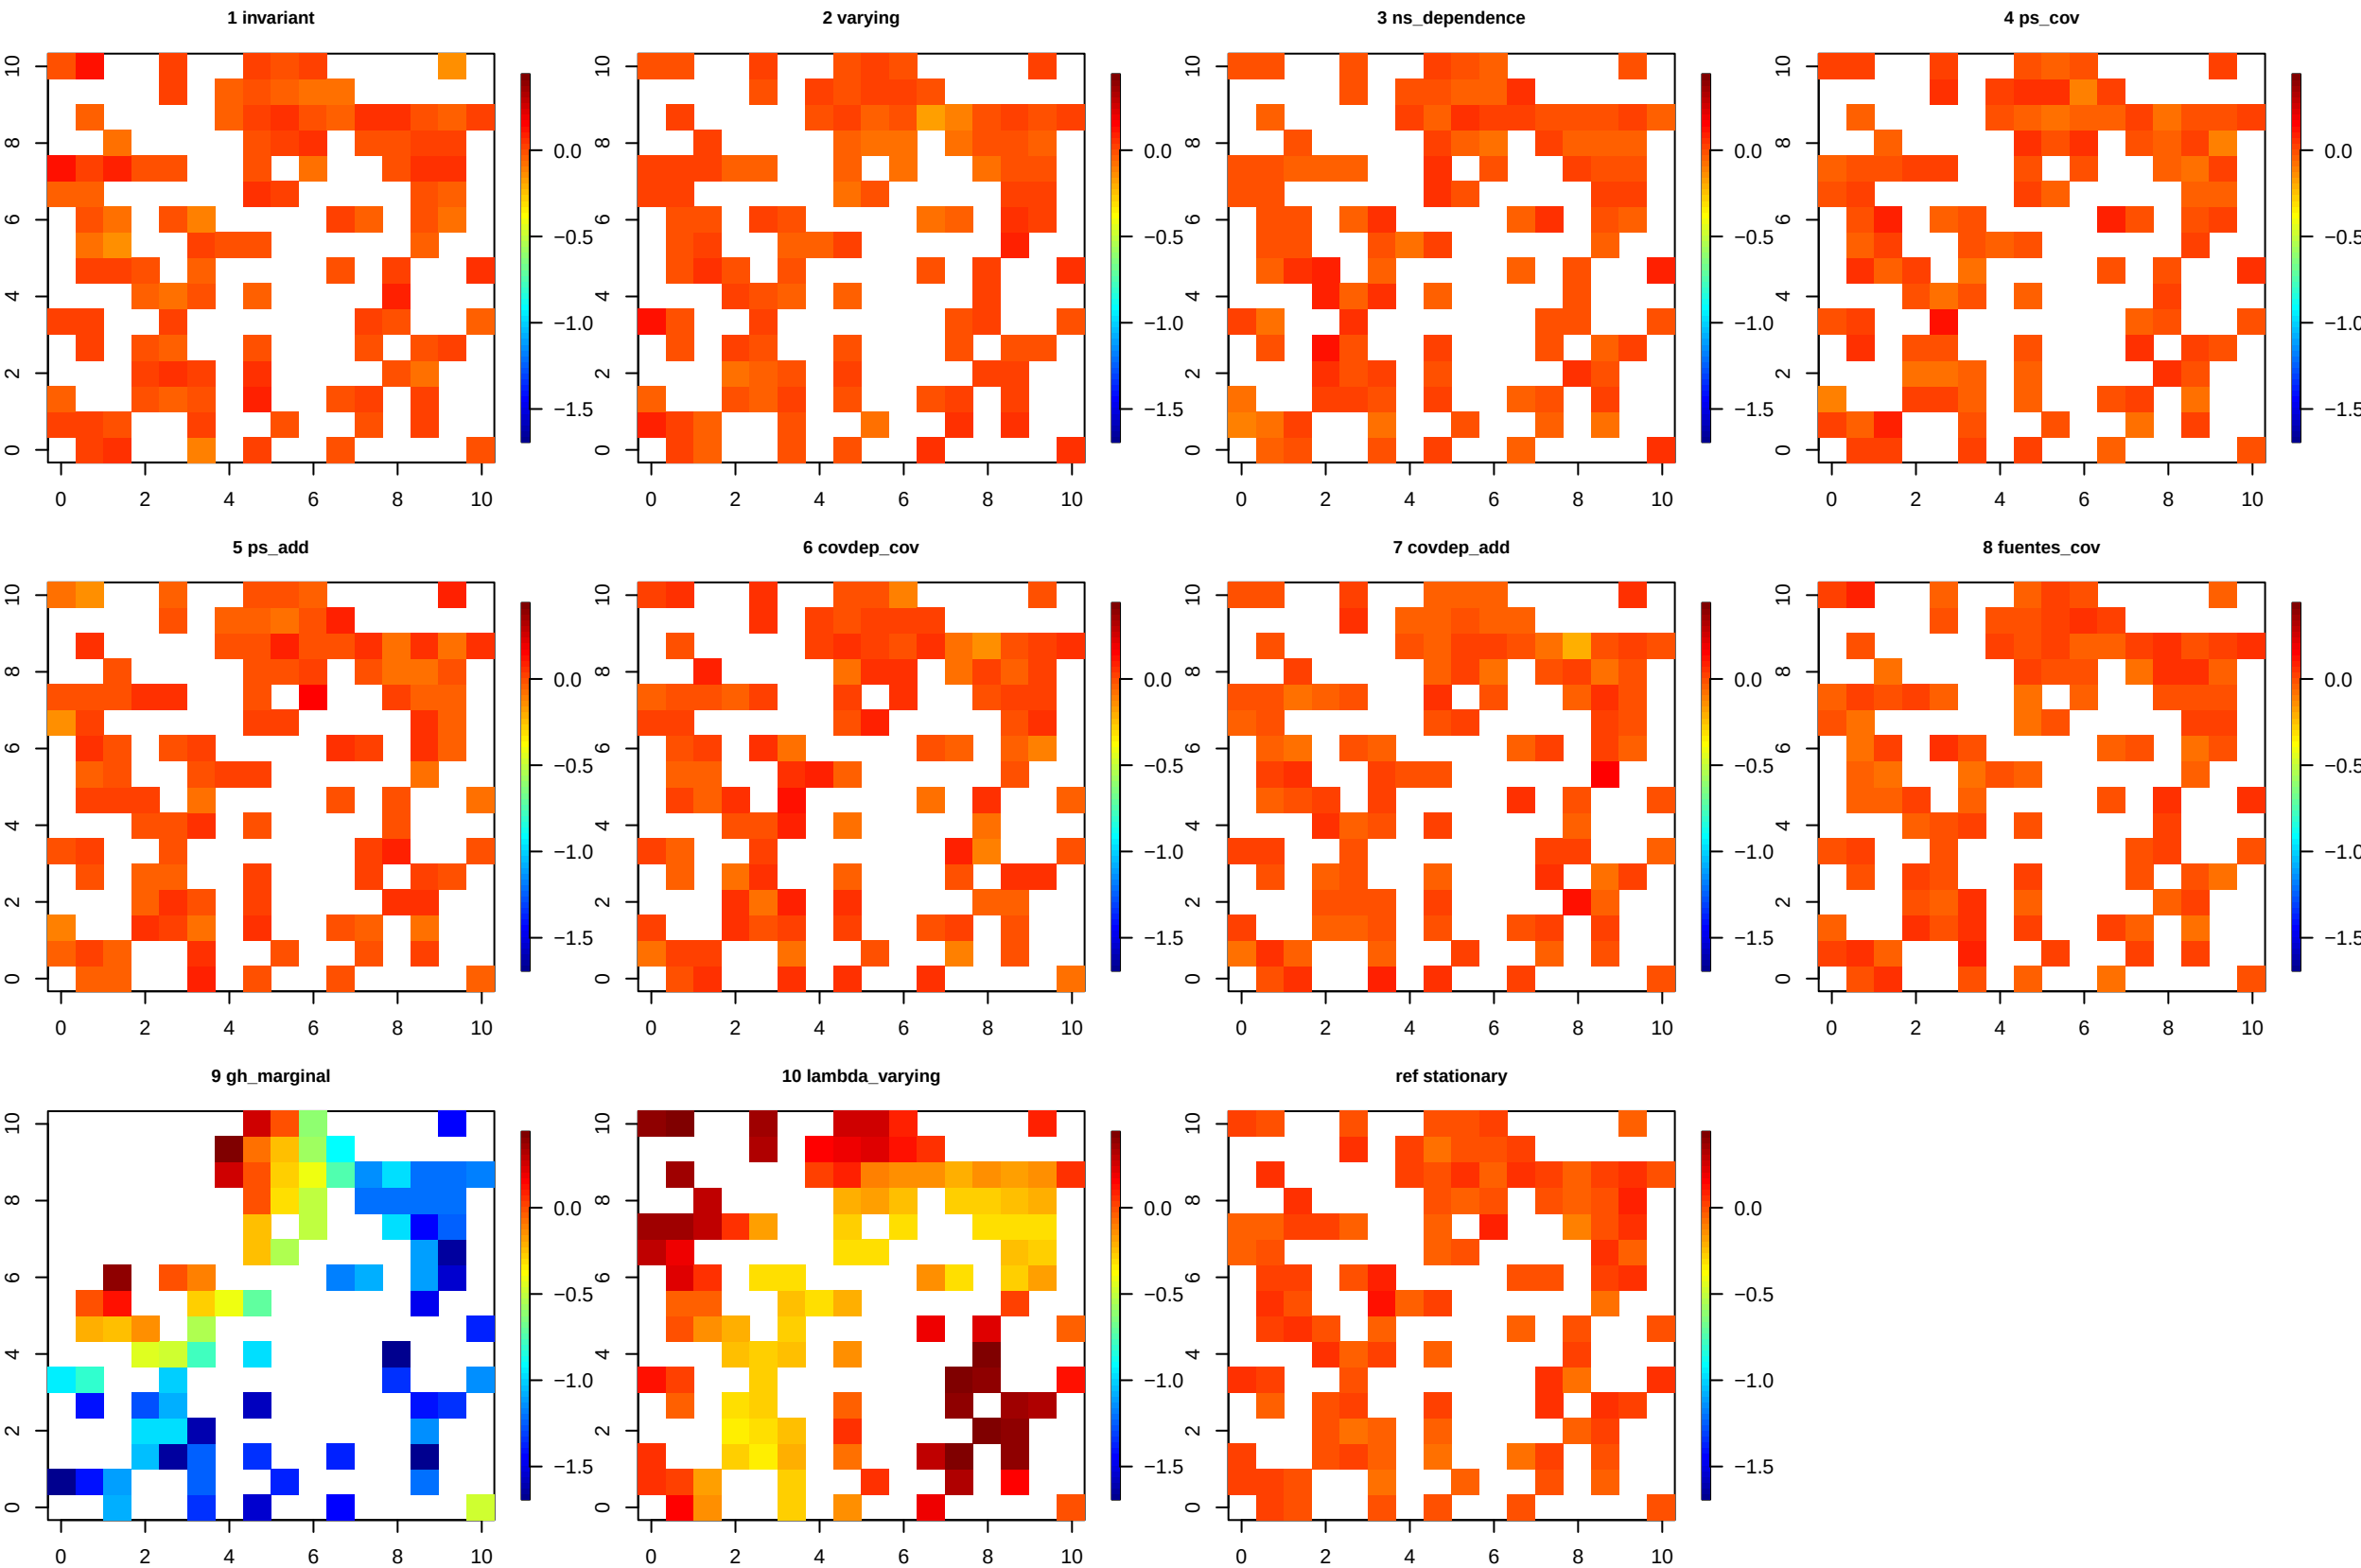

Variogram by quadrant -- curves SEPARATE $\Leftrightarrow$ non-stationary dependence (compare the flat reference)

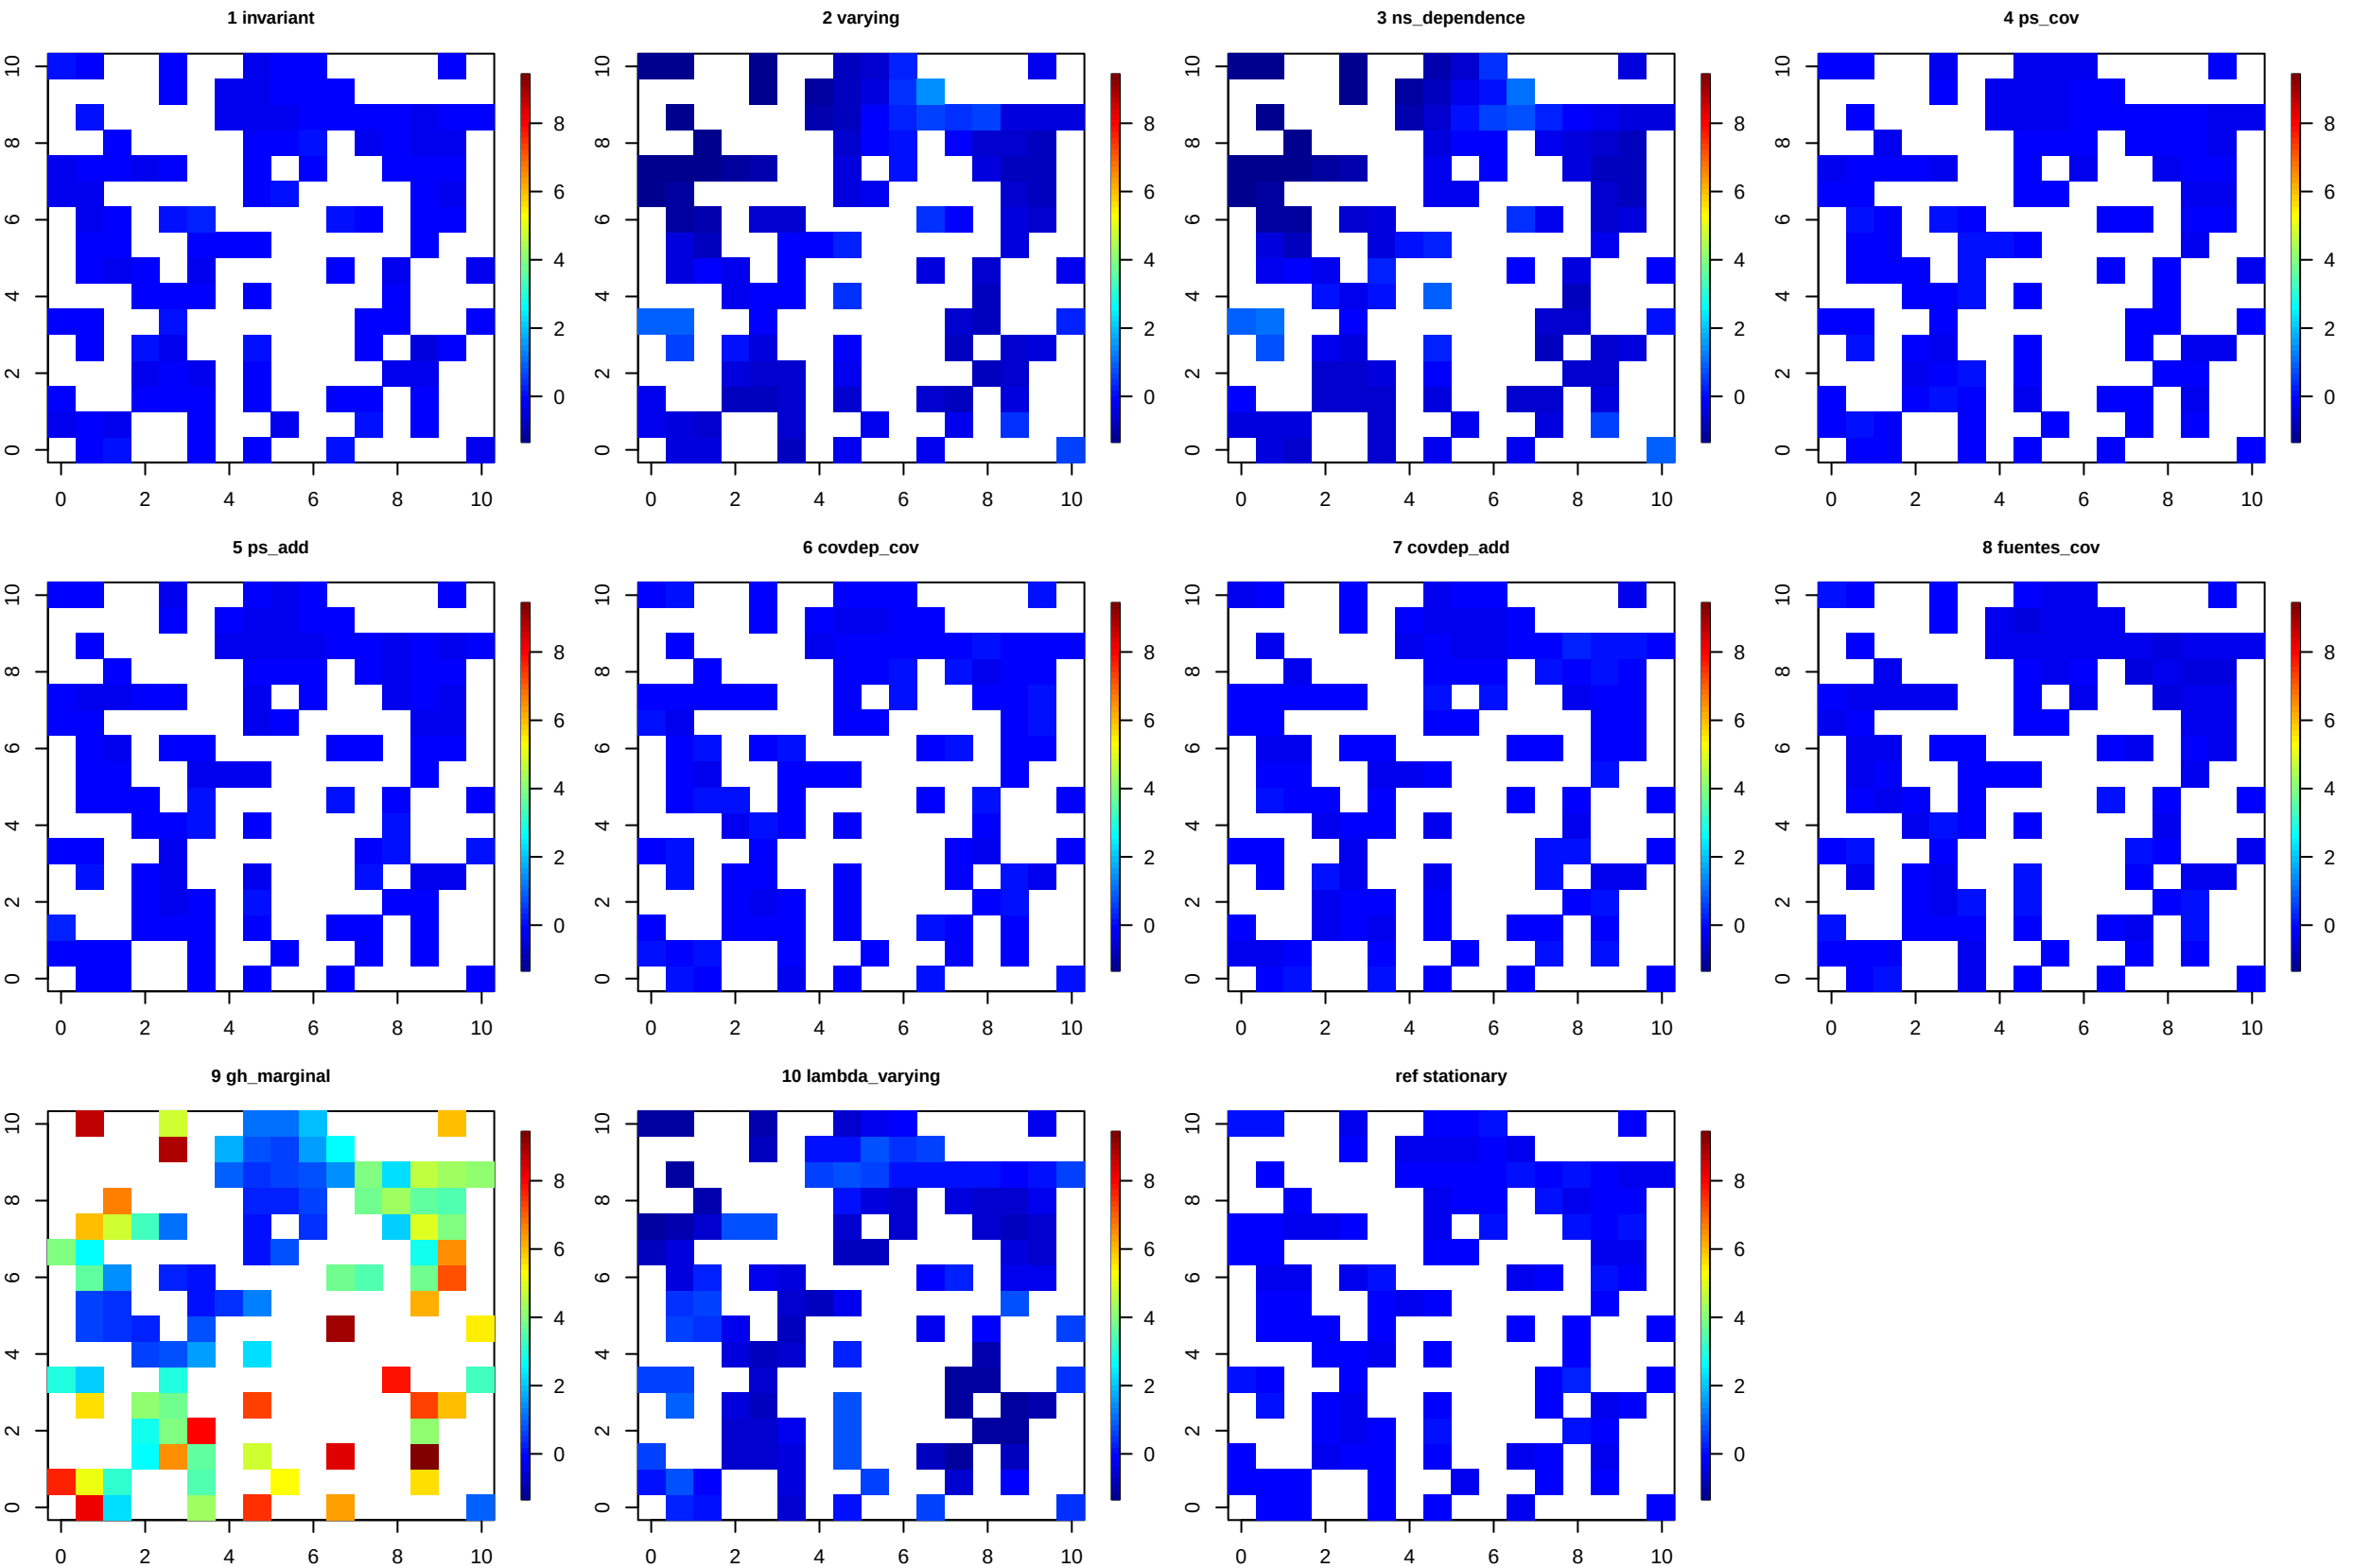

Pooled correlation vs distance
setting 3's low-rank cosine basis goes NEGATIVE at long range -- a monotone Matern cannot

Pointwise skewness of the shape residual -- 9 should track $g(s)$ (SIGN CHANGE), 10 should track $\lambda(s)$

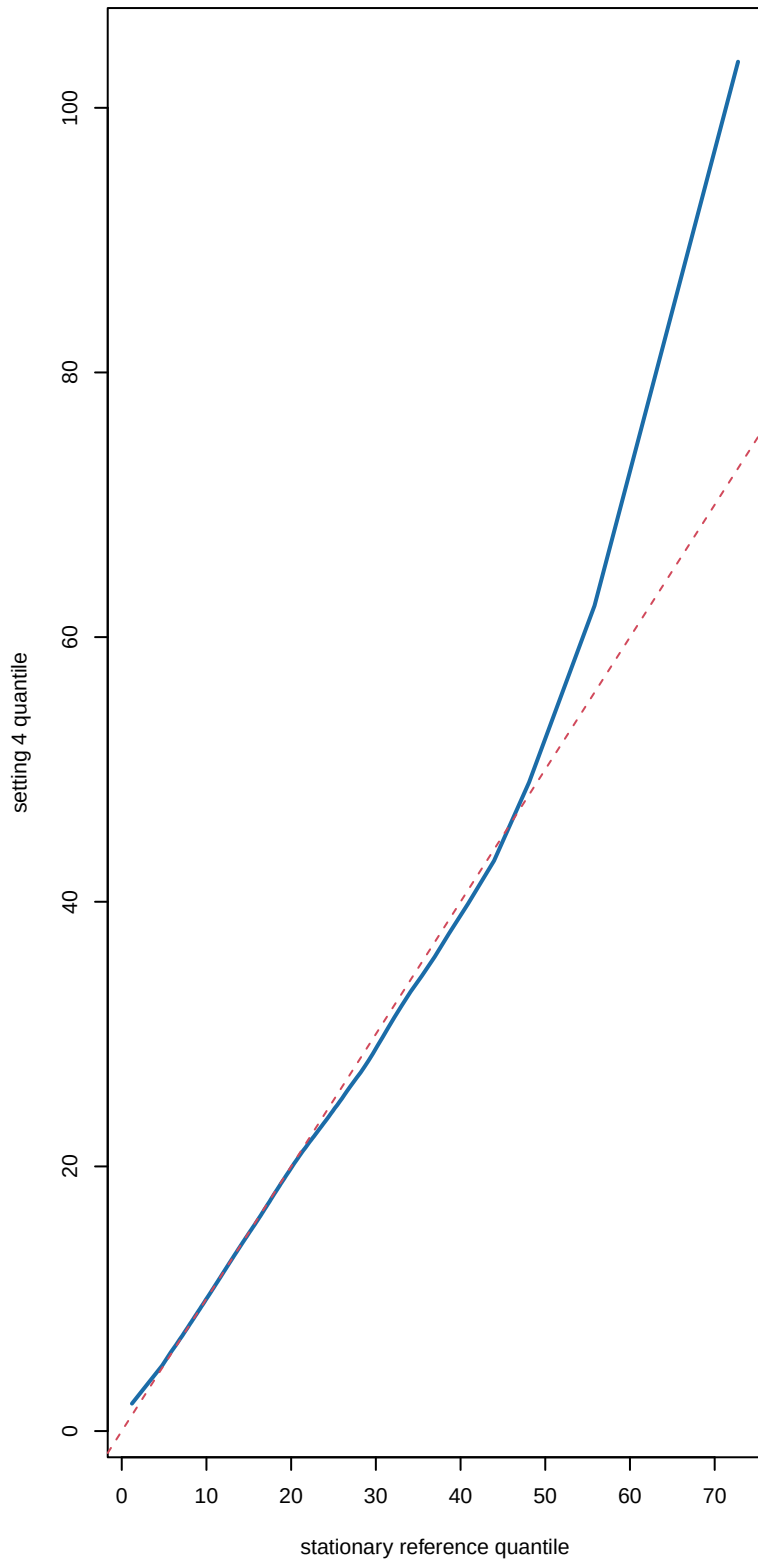

Pointwise excess kurtosis -- setting 9 should track $h(s)$

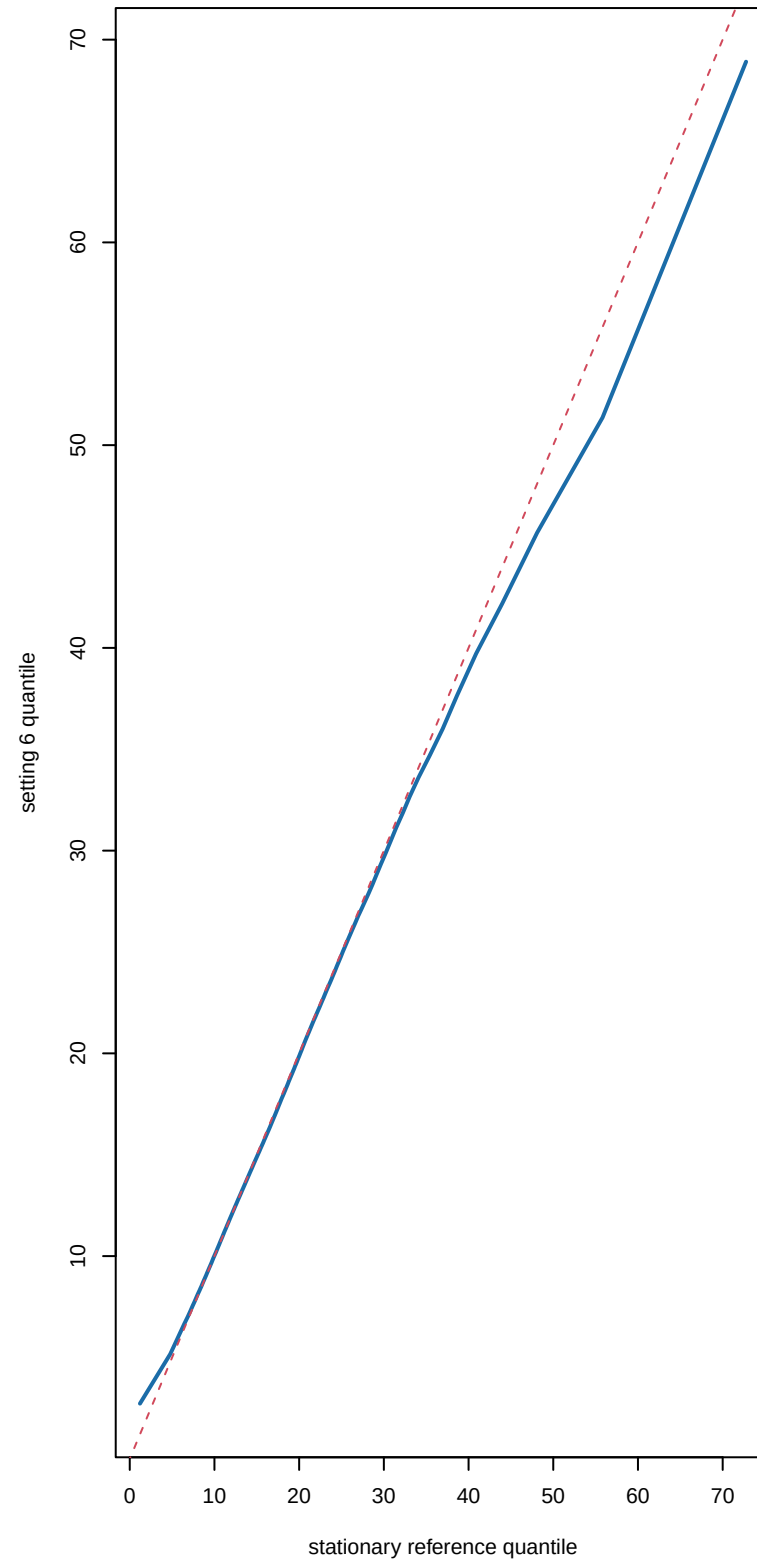

replace_C settings changed the DEPENDENCE only -- the marginal must sit on the diagonal
