

Non-stationary sim: the SAME cosine field $f_1(s)$, placed in a different moment (paired, datasets 1–3)

Setting 1: f_1 in the MEAN
(MRTS should recover it)

Setting 6: the SAME f_1 in the RANGE
(MRTS structurally cannot)

Setting 1: Brier (mean over exceedance probs)

Setting 6: Brier (mean over exceedance probs)

Everything relative to the same method's own $K=0$ fit. Below the dashed line = MRTS helps.

Far-tail Brier -- where a mean-only basis is most likely to be oversold

Setting 1: Brier at $q = 0.99 / 0.995$

Setting 6: Brier at $q = 0.99 / 0.995$
